# Infinity Cloud
## for Enterprise Cloud Printing

*Modern Cloud Printing for the New Normal.*

**Centric**
Business Systems
POWERED BY ubeo

*Infinity Cloud Print is a cloud printing service that offers a secure cloud printer management platform, adding value through print statistics tracking, centralized remote print management of direct IP printing, and simplified end-user printing.*

Since it's inception, Cloud Printing has been a convenient service. Cloud Printing provides secure printing and print management capabilities. Cloud printing solutions can provide a seamless user experience on both desktop and mobile devices, and extended utility on legacy printers.

Despite these obvious advantages, there are still many companies who have not adapted their technology to the rapidly changing times. These organizations are spending unnecessary time and money directly managing legacy systems that may provide little insight on real costs and create security vulnerabilities for networks.

The Infinity Cloud Print Management Platform addresses these challenges. The solution enables organizations to leverage their commonly used platforms and services regardless of location or infrastructure while eliminating the significant labor and expense of on-prem servers. With the Infinity Cloud App, users can scan to themselves via email, Google Drive and OneDrive for Business including sub-folder navigation! Infinity Cloud App offers a secure API integration to XMedius' Fax Server Solution. The fax server integration allows users an easy, familiar interface while increasing security at traditionally vulnerable user endpoints

## Key Benefits

### CLOUD BASED USER MANAGEMENT
Infinity Cloud is a web-based user management portal allowing administrators to configure users globally. Any Infinity Cloud enabled MFP with internet access can leverage this user database without any on premise infrastructure. The system integrates with Azure, Google and OKTA.

### SECURITY
Infinity Clouds investment into security gained them SOC II and ISO 27001 certifications. User authentication methods maintains customers' existing 2FA standards and all data connections are encrypted.

### USER AUTHENTICATION
Users authenticate at the MFP utilizing Proximity cards and PIN codes. This secures the MFP and automates many commonly used features like Printing, Scanning and Faxing.

# Product Highlights

### SCAN TO EMAIL

Leveraging the user information provided by the Proximity Card or PIN code, Scan to Myself streamlines scan to email by auto populating the email with the users email address. This eliminates the need for address book management and increases security by setting the FROM email address to the user instead of a generic email address. All email communication is encrypted with TLS 1.2

### FAXING POWERED BY XMEDIUS CLOUD

The users' fax experience is better than a traditional MFP with a fax line. The native connector communicates to xMedius Cloud's datacenters with your unique encryption key securing the tunnel and streamlining configuration and troubleshooting. This allows all devices to fax without fax lines eliminating the expense of traditional fax lines. The technology increases access, and security/compliance (HIPAA, PHI) as faxes are transmitted as the user instead of device. Faxes, coversheets and confirmations are delivered electronically as a user instead of the MFP.

### SECURE PRINT

Infinity Clouds Universal Print Driver allows users to print to the cloud and then retrieve their print job from any Infinity Cloud enabled device without any server or appliance required. This is a Zero Trust topology enabling work from home, the office, a hotel, and even shared office spaces.

### CLOUD PRINT DRIVER MANAGEMENT

Automatic creation of Direct IP printers by user or location allows for elimination of print servers. The key feature is the ability to push manufacture drivers for Windows via the cloud and keep print traffic local giving users the choice between Follow Me Print or direct print.

### SCAN TO CLOUD SERVICES

Users simply scan to their OneDrive and Google folders from the touchscreen of the MFP utilizing token-based security. Users at the point of scan can browse their folder structure saving a document to its final destination eliminating the need of moving a document a second time back at their desk.

# How It Works

With just an internet connection, printers are migrated, and users are created in the Infinity Cloud administration portal. Once the Infinity Cloud agent is pushed to users' workstations and printers are configured, print drivers will automatically be installed locally allowing users to print direct IP to printers and Secure Print through the Infinity Cloud platform.

The user then simply needs to select PRINT and the print job will be sent directly to the IP printer. Print jobs can also be sent to the Cloud to be released on demand through any mobile device or MFP Touch Screen.

Infinity Cloud allows organizations to reduce costs by eliminating on-premise servers without losing features or functionality while providing users flexibility and increased capabilities.
